Abstract

Peganum harmala L. (Zygophyllaceae) is burned into ash-cake ("Aşkar") in Emirdağ (Afyon), Middle Anatolia. The plant has been widely known as Üzerlik in Anatolia in addition to other names. In this study, both the production and usages of the ash-cake from *Peganum harmala* L. in Anatolia has been described. It has ethnobotanical importance in protecting silk and hair and as fumigant.

The plant *Peganum harmala* L. grows naturally in Turkey (Davis 1965-1985) and is a popular plant in traditional medicine. It is locally known by Askar, Üzelliik, Wild Garden Rue, İlezik, Nazarotu, Üzerik and Üzeriyh, Üzerlik (Baytop 1984, 1994). It is registered in the Turkish Pharmacopeia among the medicinal plants. The plant is known to have been used in the treatment for epilepsy, varicose veins, headaches, allergic influenza, hay fever, joint and rheumatic pains, hemorrhage, sexual potency enhancer and in pregnancy, elephantiasis and urinal incontinence/bed wetting (Prashanth and John 1999, Monsef *et al.* 2004, Kartal *et al.* 2004, Pieroni *et al.* 2005, Durrani and Manzoor 2006, Panhwar and Abro 2007, Zaker *et al.* 2007, Shahverdi *et al.* 2008). Furthermore, one very common use is said to be protection against the evil eye. The seeds having 'Turkish' shade of red has also led its use in red paint, according to several sources. When drunk together with Indian Hemp (*Cannabis sativa* L.) flowers, it is claimed that it gives the power 'to make a blind man see', increases the power of imagination, as well as boosting the effect of narcotics when supplemented. A known use in the past in Central Anatolia of its ash as soda or soap. Aşkar made from the plant is still known to be used as a cleaning material in the districts of Sivas, Tokat, Nevşehir, Kırşehir and Emirdağ.

Preparation of "Aşkar" from Peganum harmala L.: Preparation and usages of 'Aşkar' are observed during June and July months in Yeniköy (Emirdağ-Afyon) and its surroundings. The dried *P. harmala* L. plants with well matured fruits are cut at ground level. 5-6 sacks of the plants are collected, 2-3 of which are placed on the top of a trivet surrounded by sheep dung and burnt. The remaining 2-3 sacks of plants are thrown on to the top of the burning plants afterwards. The burning continued for 3-4 hours into ash which looks grey-black. This ash is allowed to cool for a day. Sheep dung is placed at the circumference of the ashes on the following day, and it is again burnt. After burning the grey-black ash powder reverts to a gall state that appeared as a porous black coloured and hard structure (Figs 1a-f). The name 'Aşkar' is given for this charcoal of gall. Approximately 1 kg of 'Aşkar' is obtained from 5-6 sacks of plants.

In addition to use for washing, the 'Aşkar' is used for hair and skin care. A piece, the size of a matchbox of 'Aşkar' is placed in a bucket of water and boiled, allowed to cool, and is used as green soap. Hair looks more lively and gives shiny appearance, removes dandruff and skin becomes tight. The widespread 'Aşkar' culture in this region in particular, is maintained by some people over the age of 50.

There is no published records on the use of *P. harmala* L. (Harmal) for hair and skin care. In this study, use of the plant in hair and skin care is reported for the first time. An investigation on the use of *P. harmala* L. (Harmal) as a homeopathic medicine may be made.
